

RESISTANCE TO DAMAGE (RD) SCORE

Analysis and utility of factors affecting ITN durability

Agenda

- Introduction
- History of RD score
- Refining RD score
- Avenues to innovation

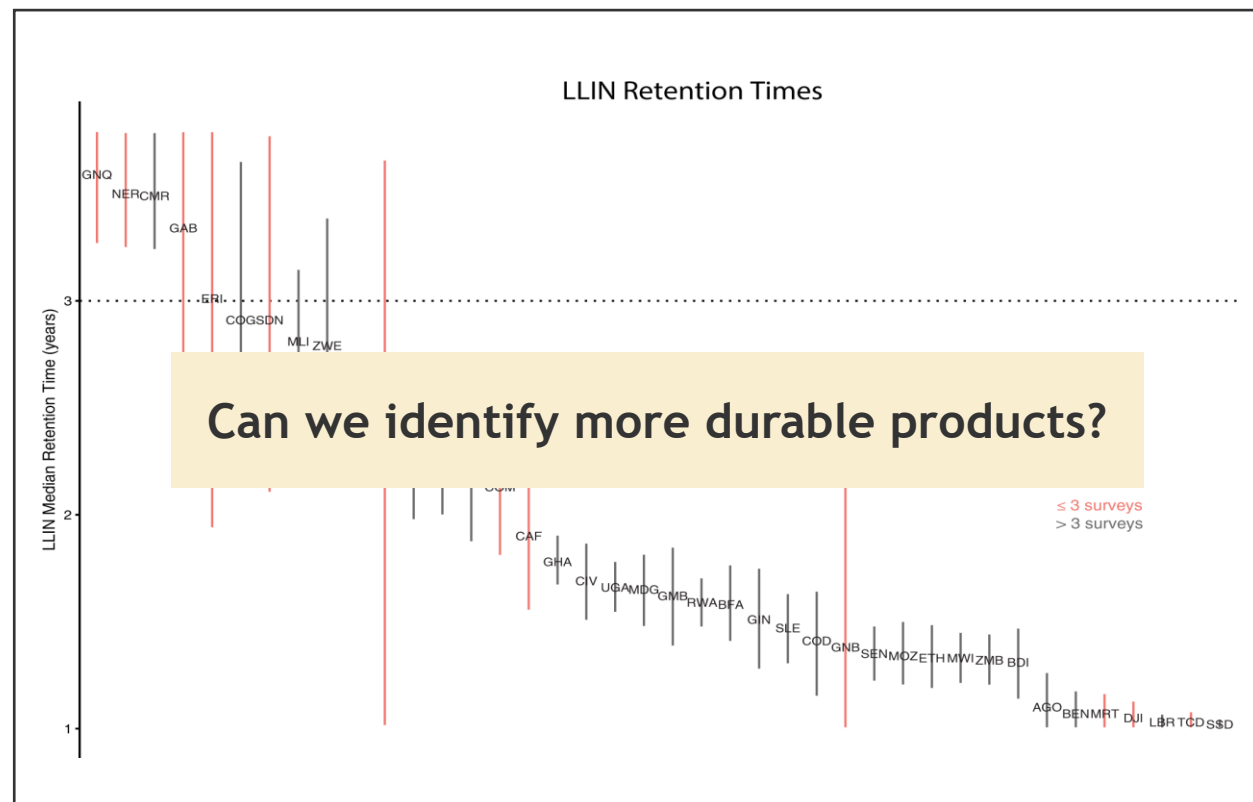

IMPOSSIBLE VC TRIANGLE

MAINTAIN COVERAGE

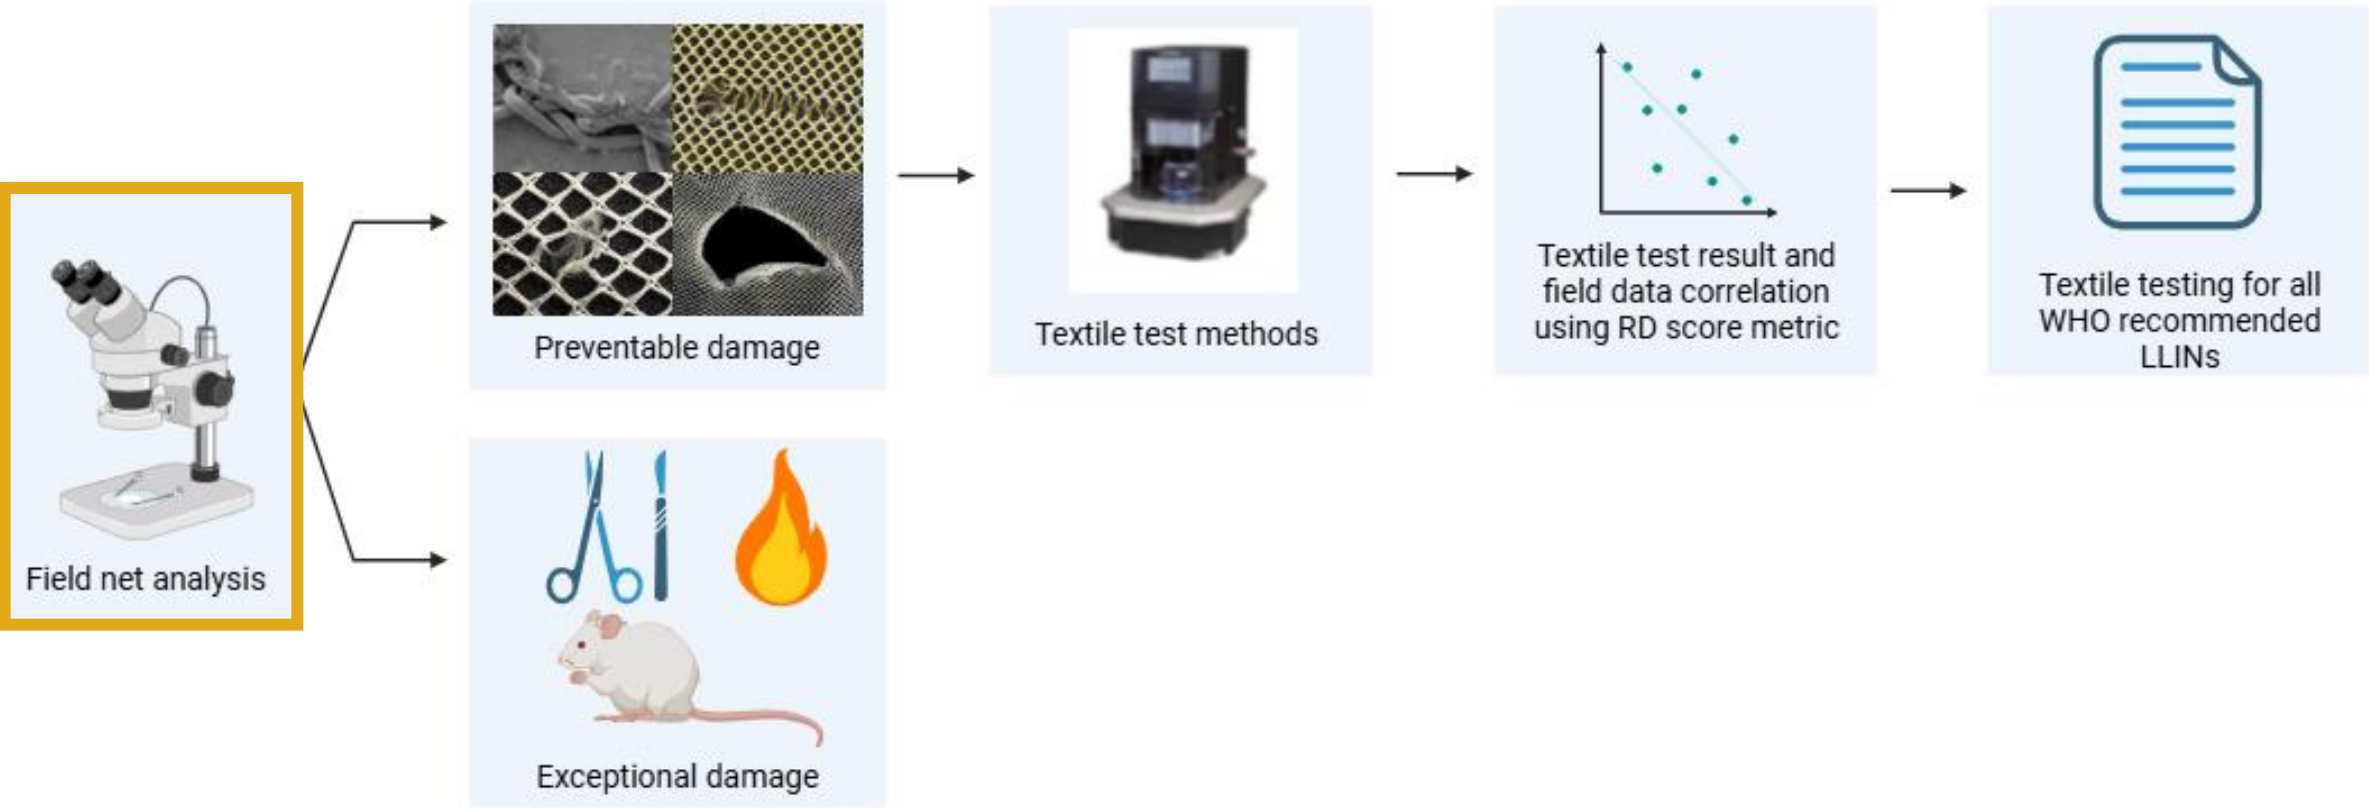

MORE, AND MORE
EXPENSIVE, TOOLS

FLAT BUDGET

Overall median value of 1.64 years LLIN retention

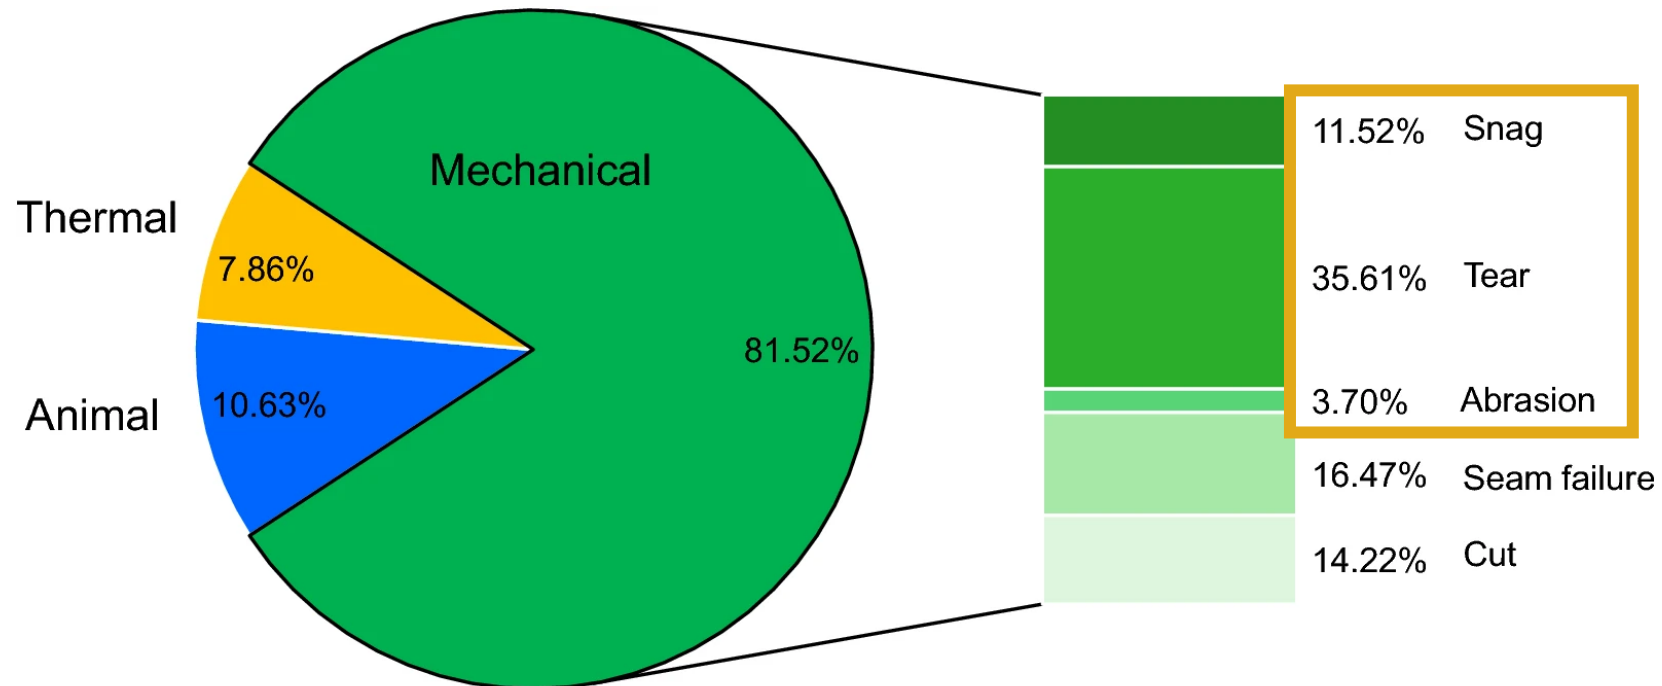

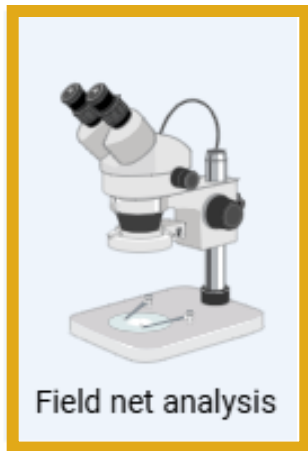

History of RD score - Overview

History of RD score - Field net analysis

Wheldrake A, Malar J. Jan 19;20(1):45 (2021)

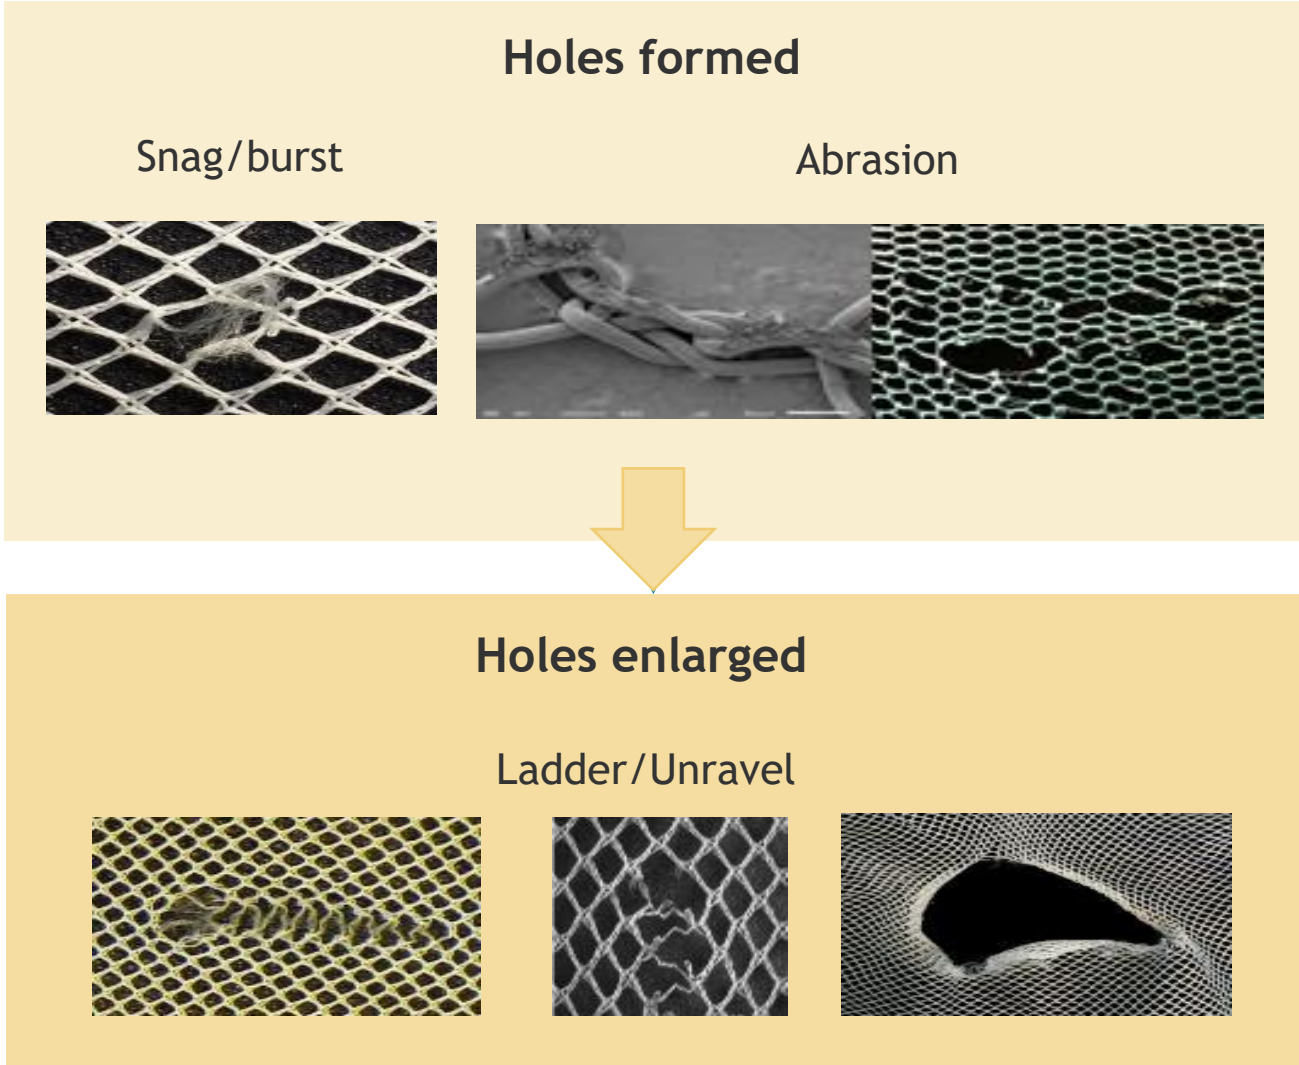

Forensically classified >40,000 damaged areas in 526 ITNs collected from 5 countries

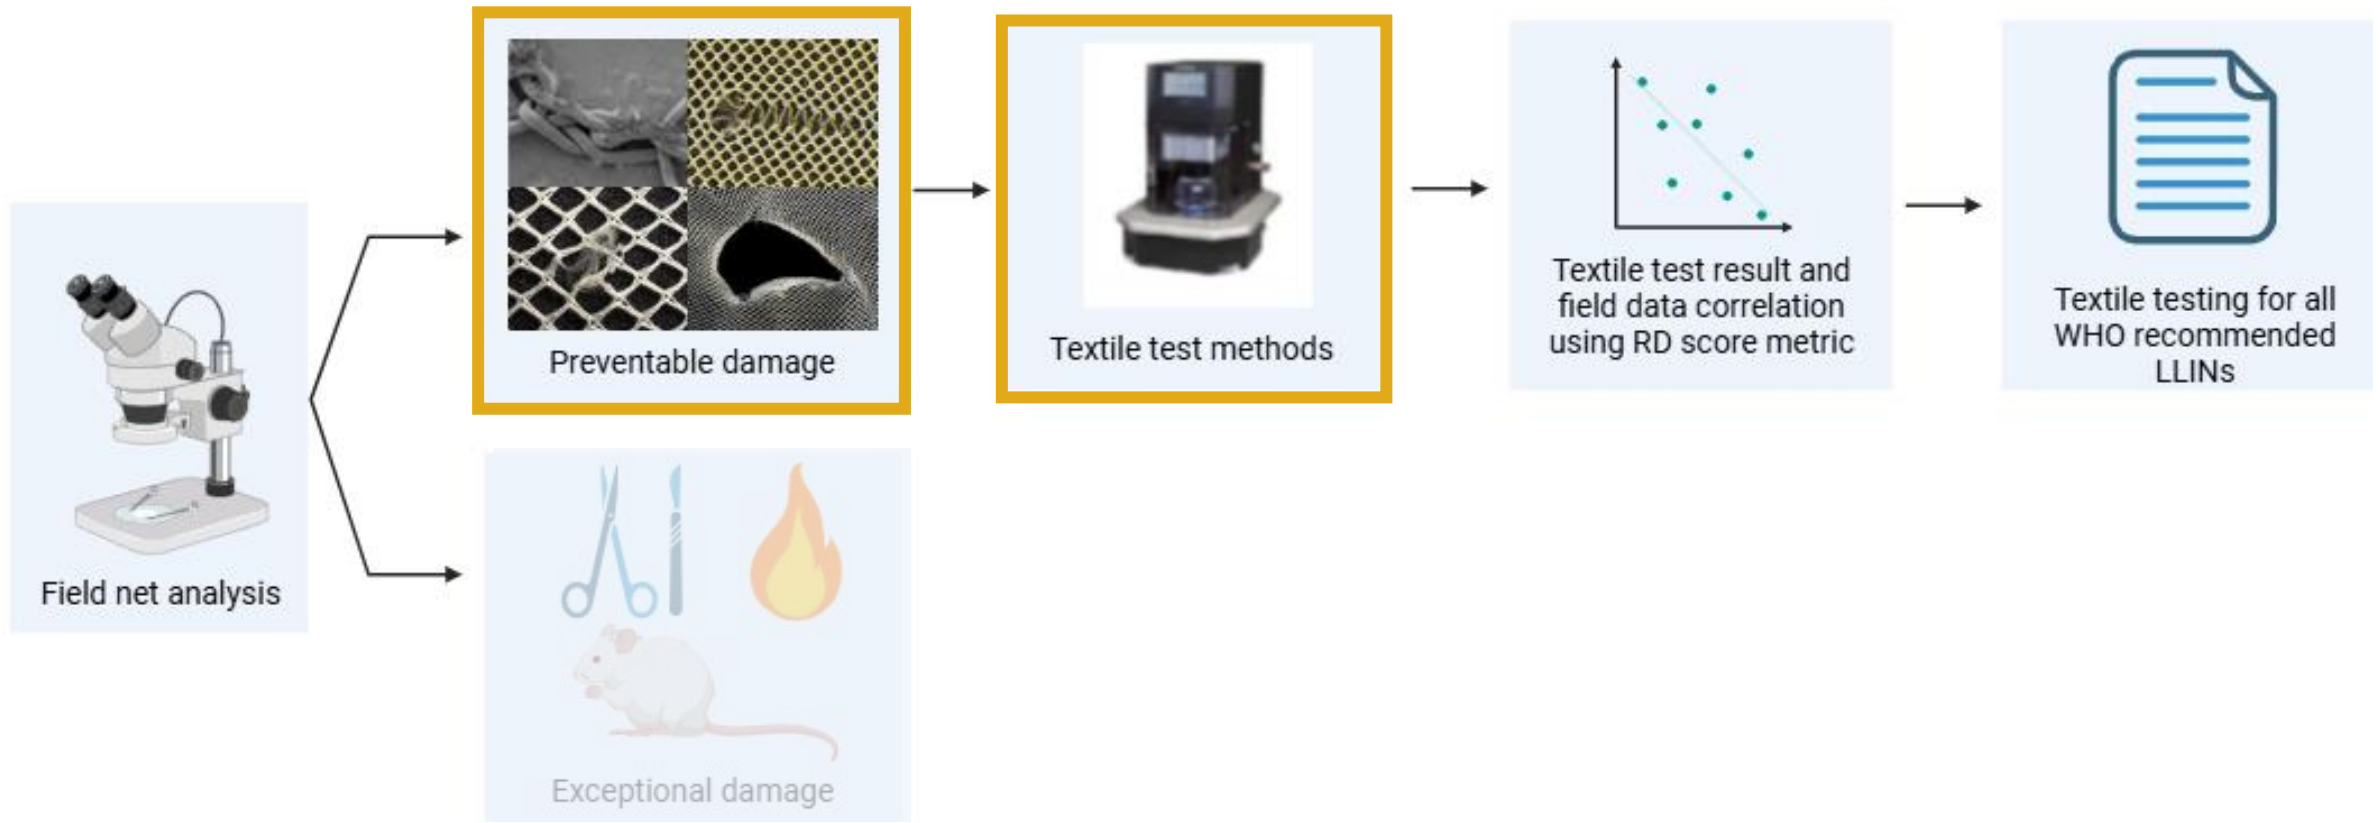

525 nets - 52% PE monofilament / 48% PET multifilament

Majority of damage is preventable

History of RD score - Division of hole types

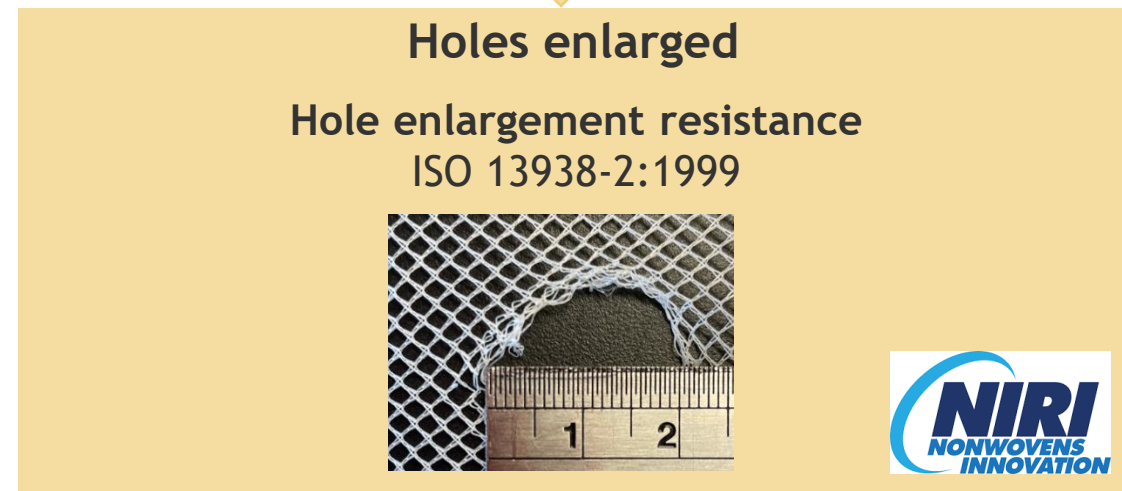

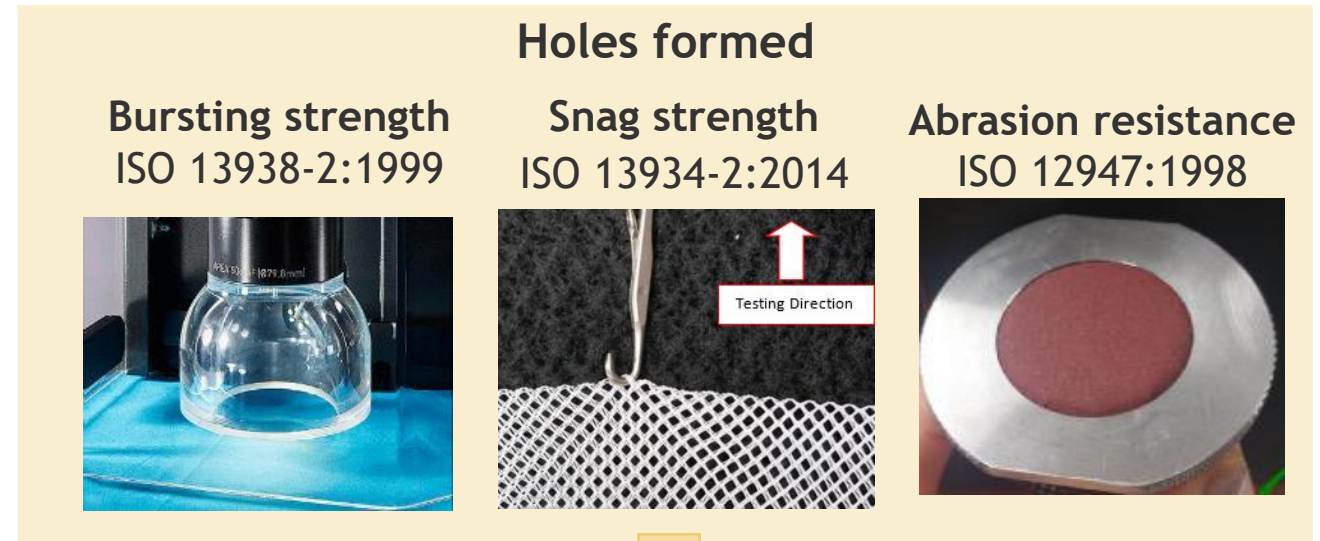

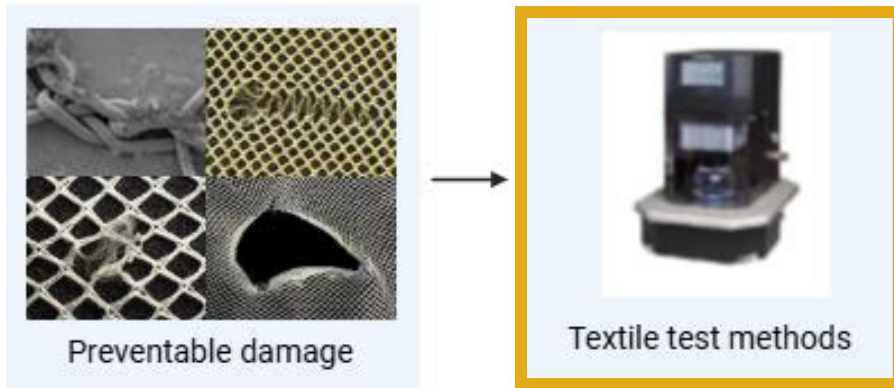

History of RD score - Textile test methods

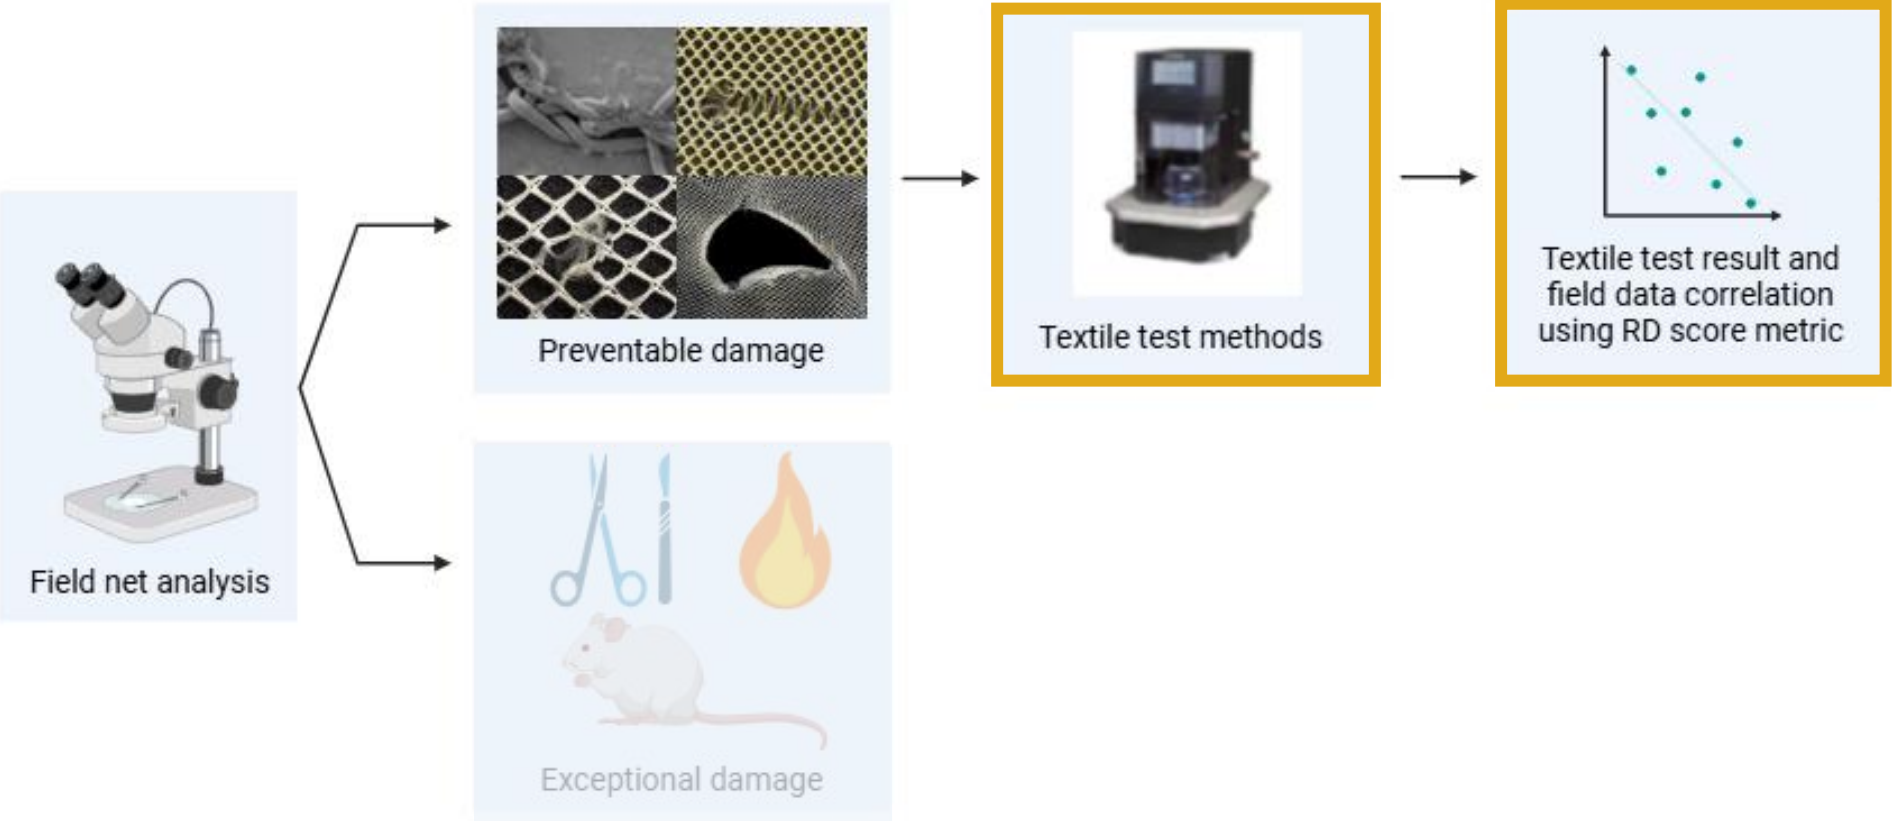

History of RD score - Textile test methods

Wheldrake, A.,. *Malar J* 20, 47 (2021)

History of RD score - RD score development

TROPICAL
HEALTH

History of RD score - Existing results

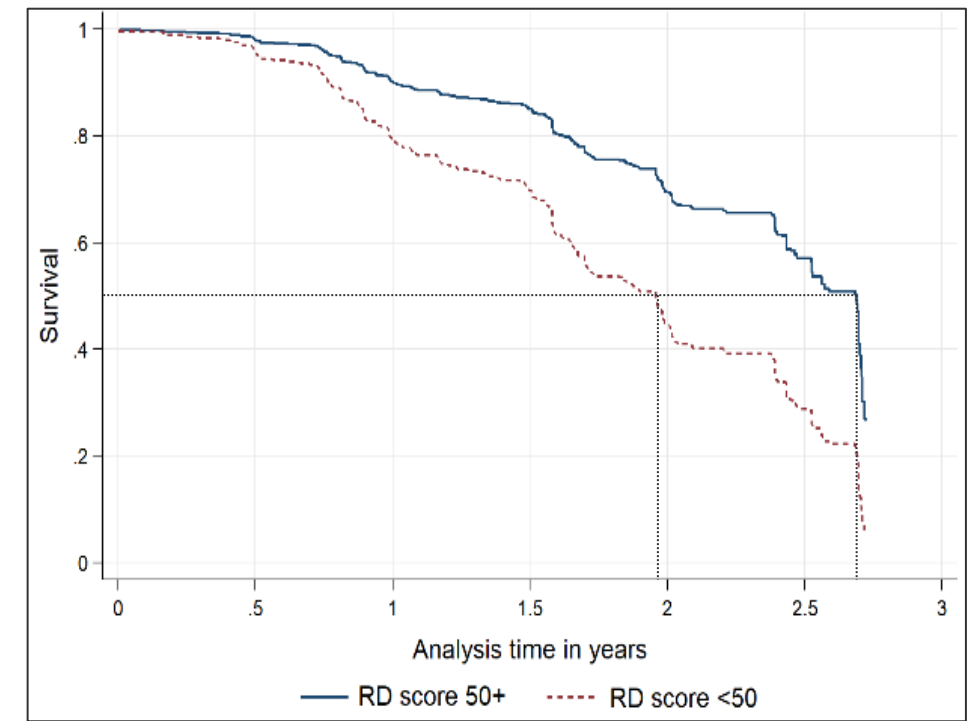

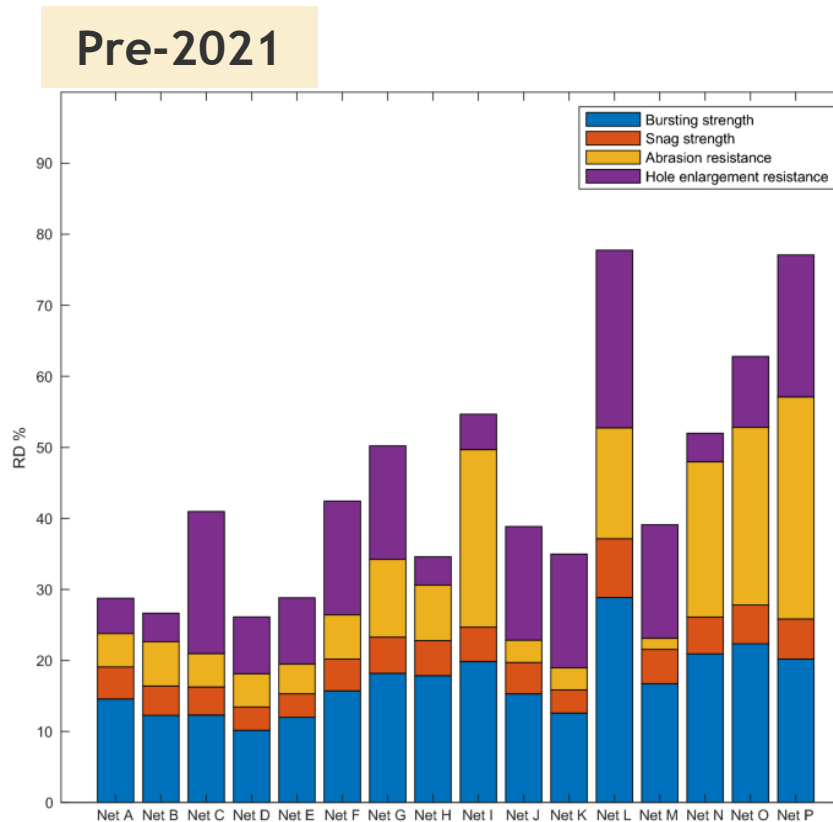

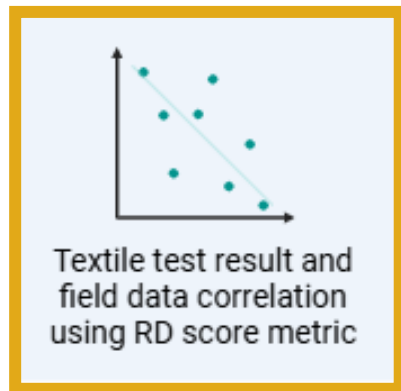

Wheldrake, . *Malar J* 20, 46 (2021)
Kilian, A., . *Malaria journal*, 20(1), 29 (2021)

25% Snag resistance

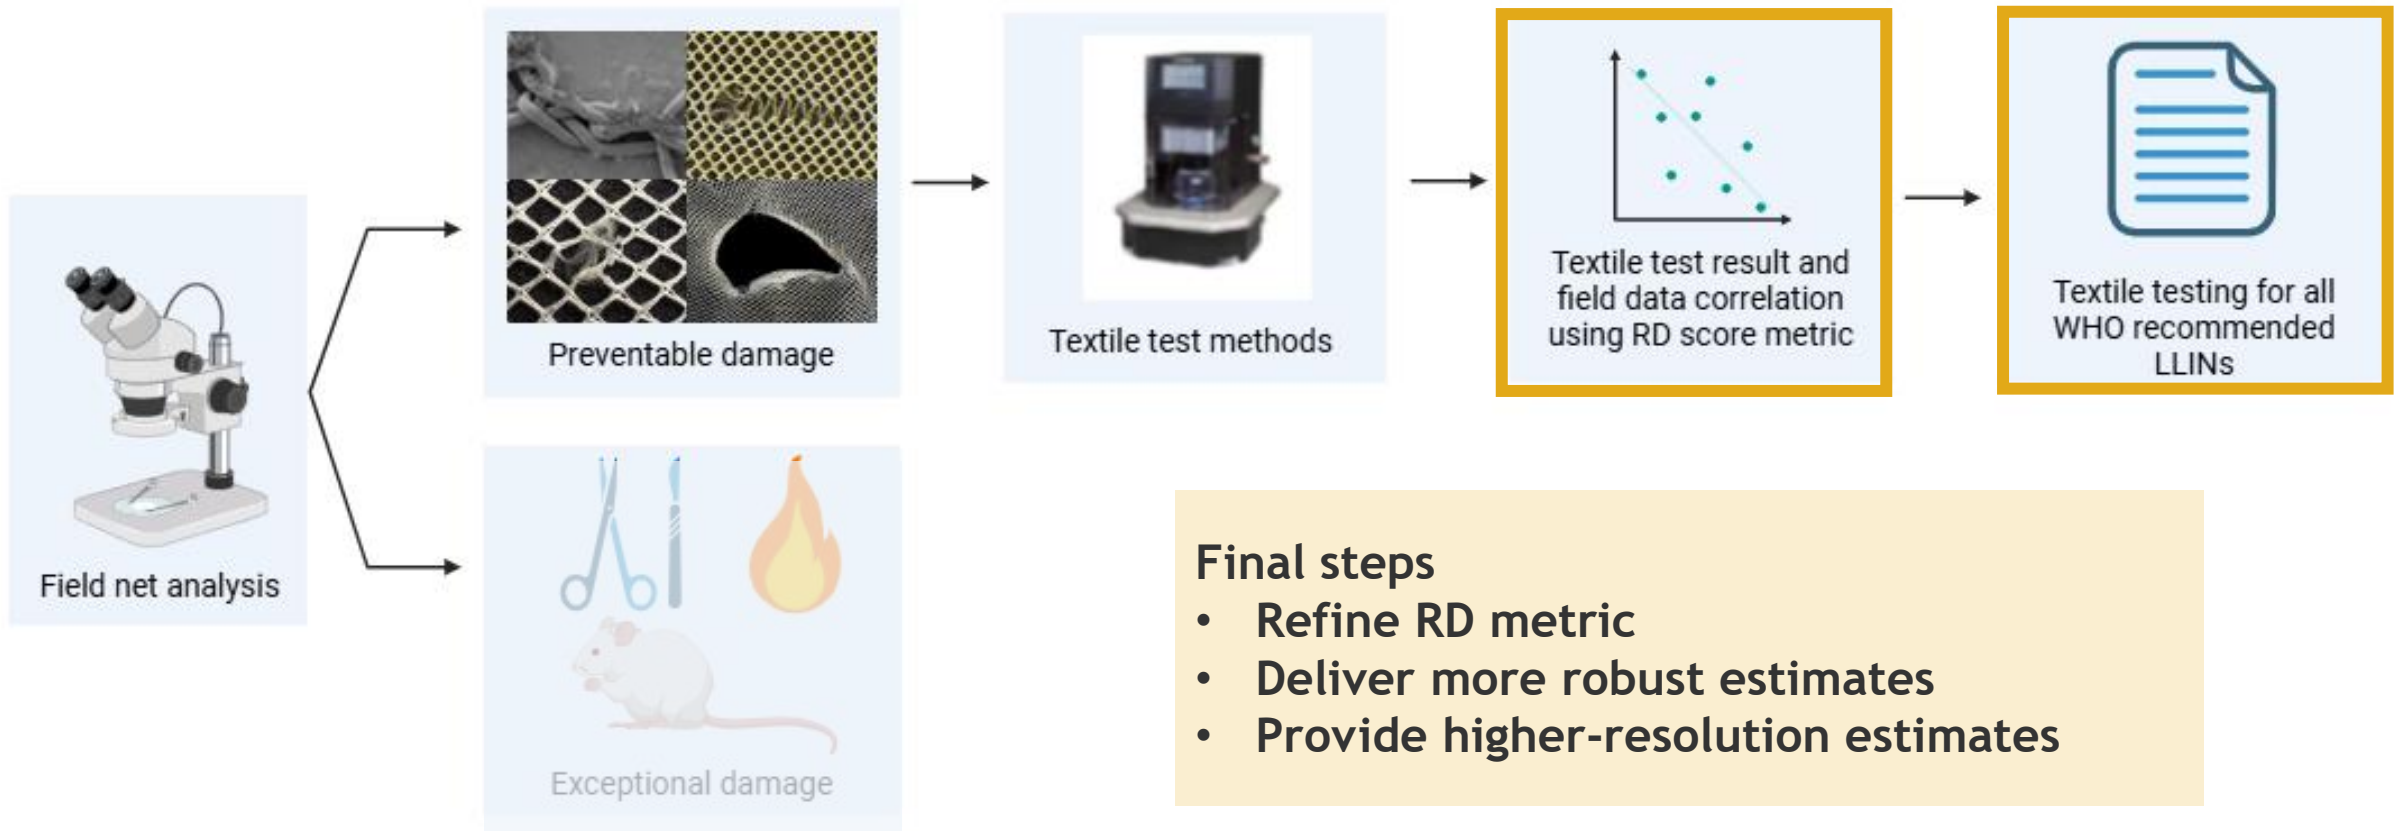

25% Bursting strength

25% Hole enlargement

25% Abrasion resistance

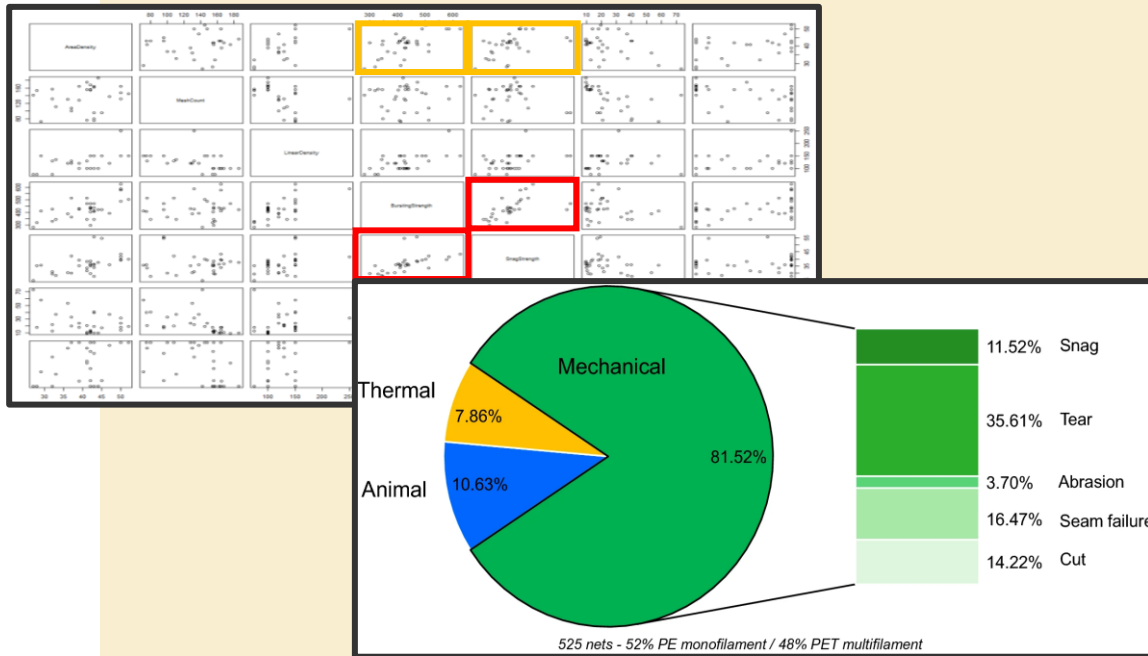

History of RD score - Final steps

Refining the RD score - Combined approach

Empirical

What does a deep-dive into the data tell us?

Holistic

What are we trying to achieve?

Purpose of durability is encourage retention and keep mosquitoes out

- Holes become major concern when they grow larger

Should we place greater emphasis on ability to prevent hole enlargement?

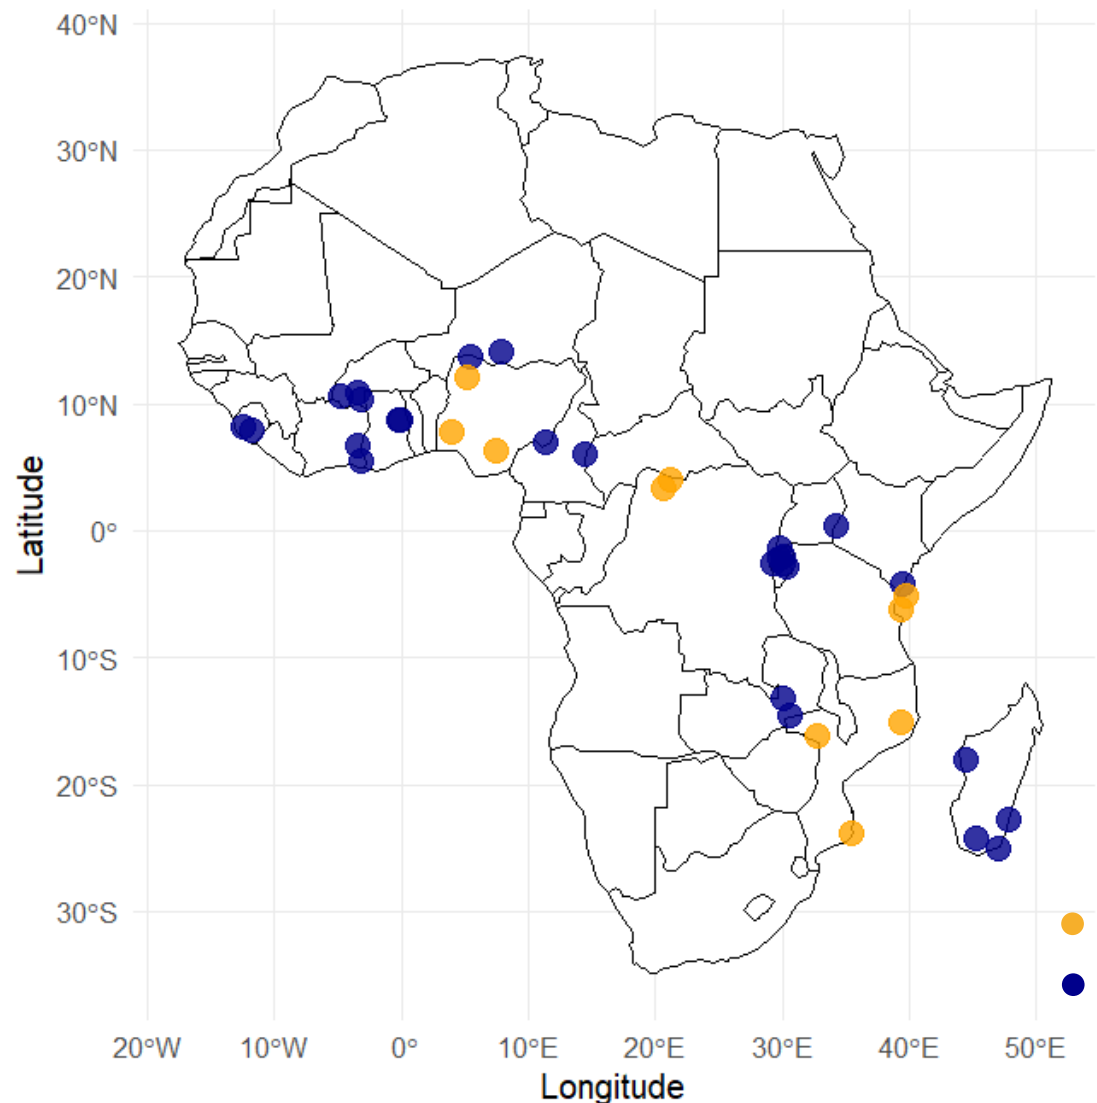

TROPICAL
HEALTH

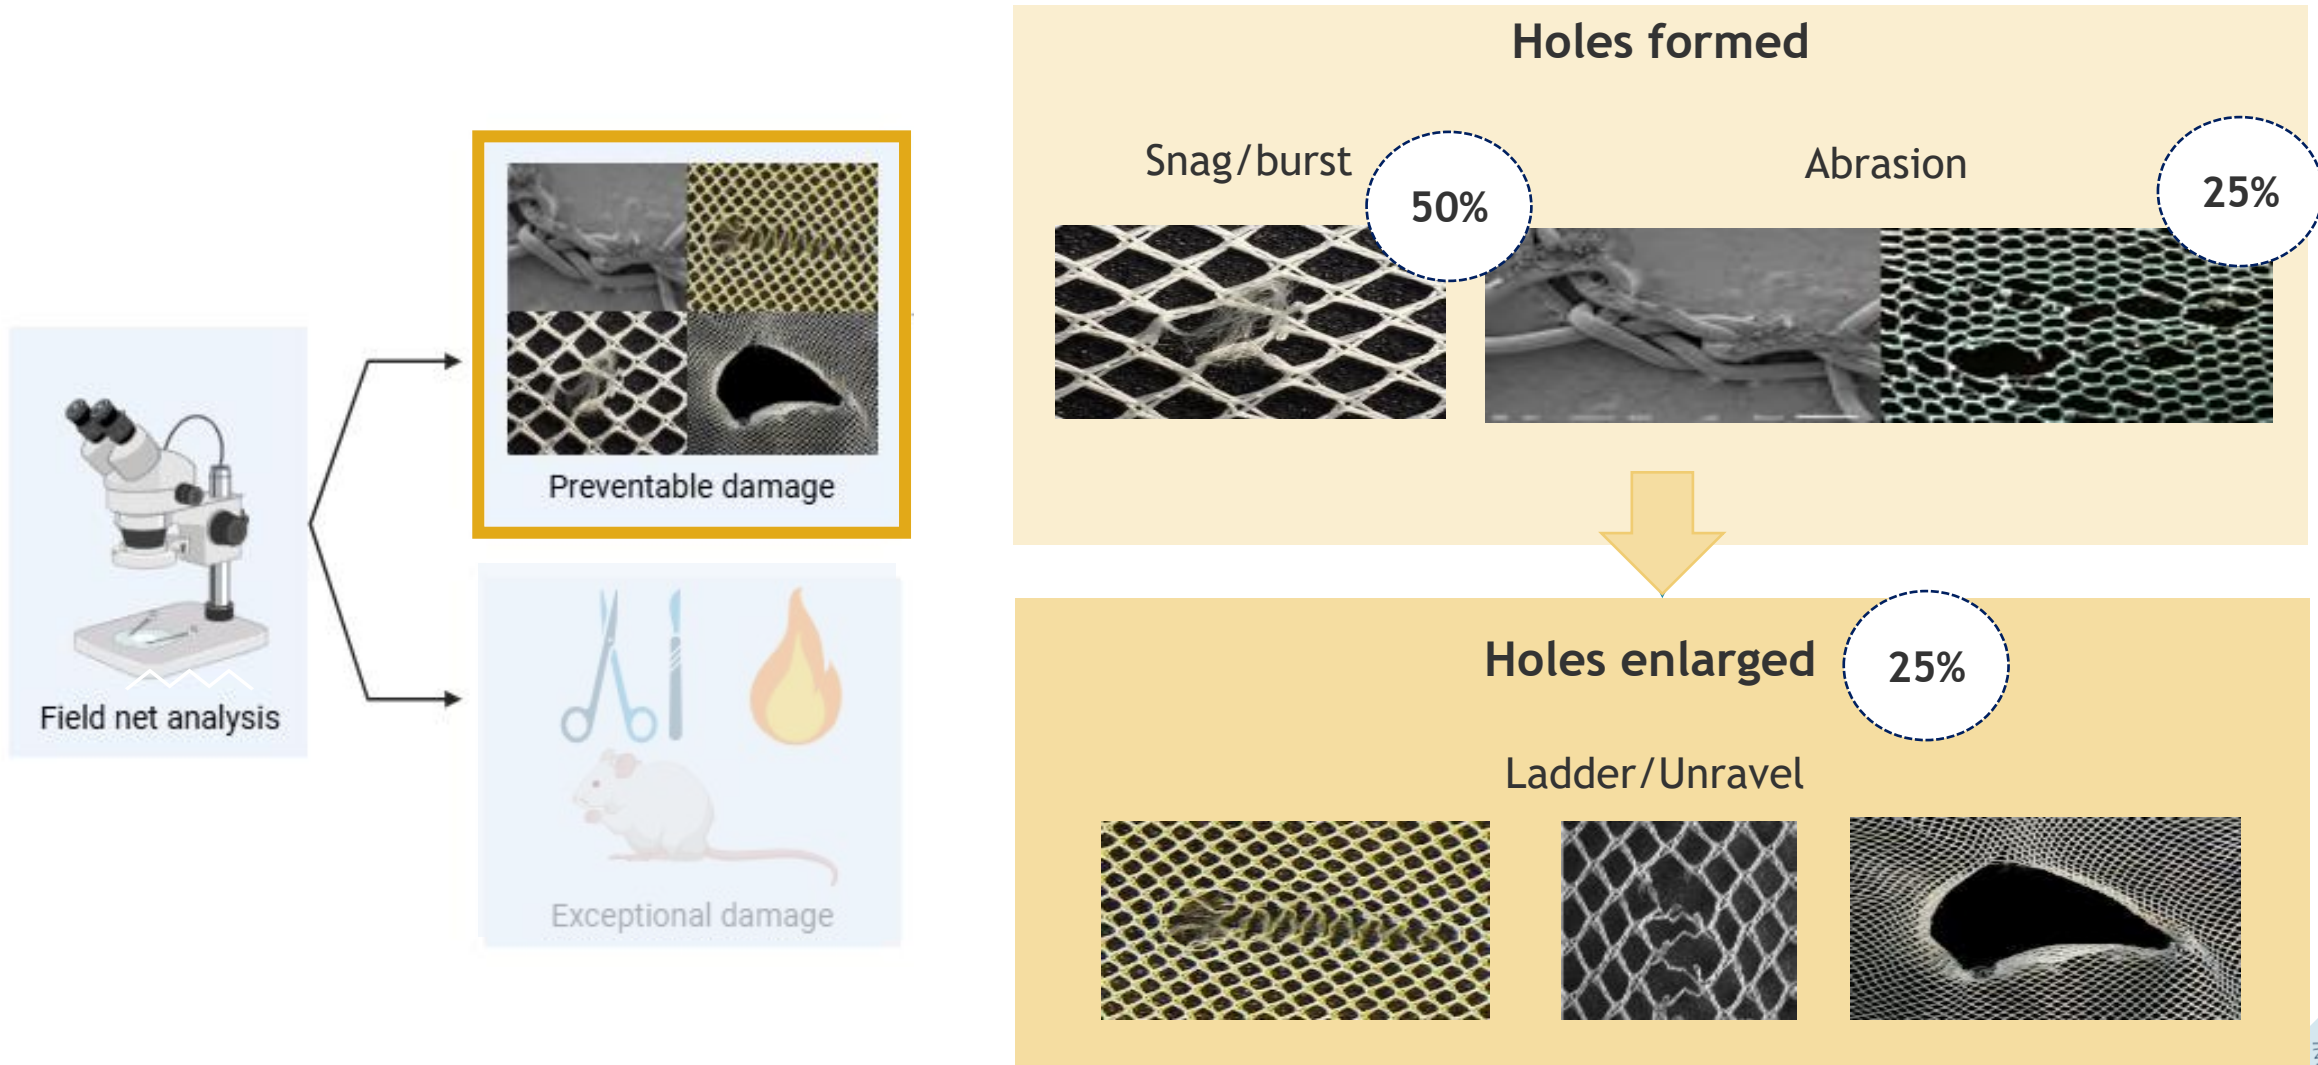

Refining the RD score - More durability data

Kilian, A.,. *Malaria journal*, 20(1), 29 (2021)

	Kilian et al., 2021	2024
Countries	4	14
Durability mon. sites	10	37
LLIN brands	6	13
Campaign LLINs	4700	9500

Refining the RD score - Abrasion removed and hole enlargement increased

Refining the RD score - Abrasion removed and hole enlargement increased

Holes formed

Snag/burst 50%

Abrasion 0%

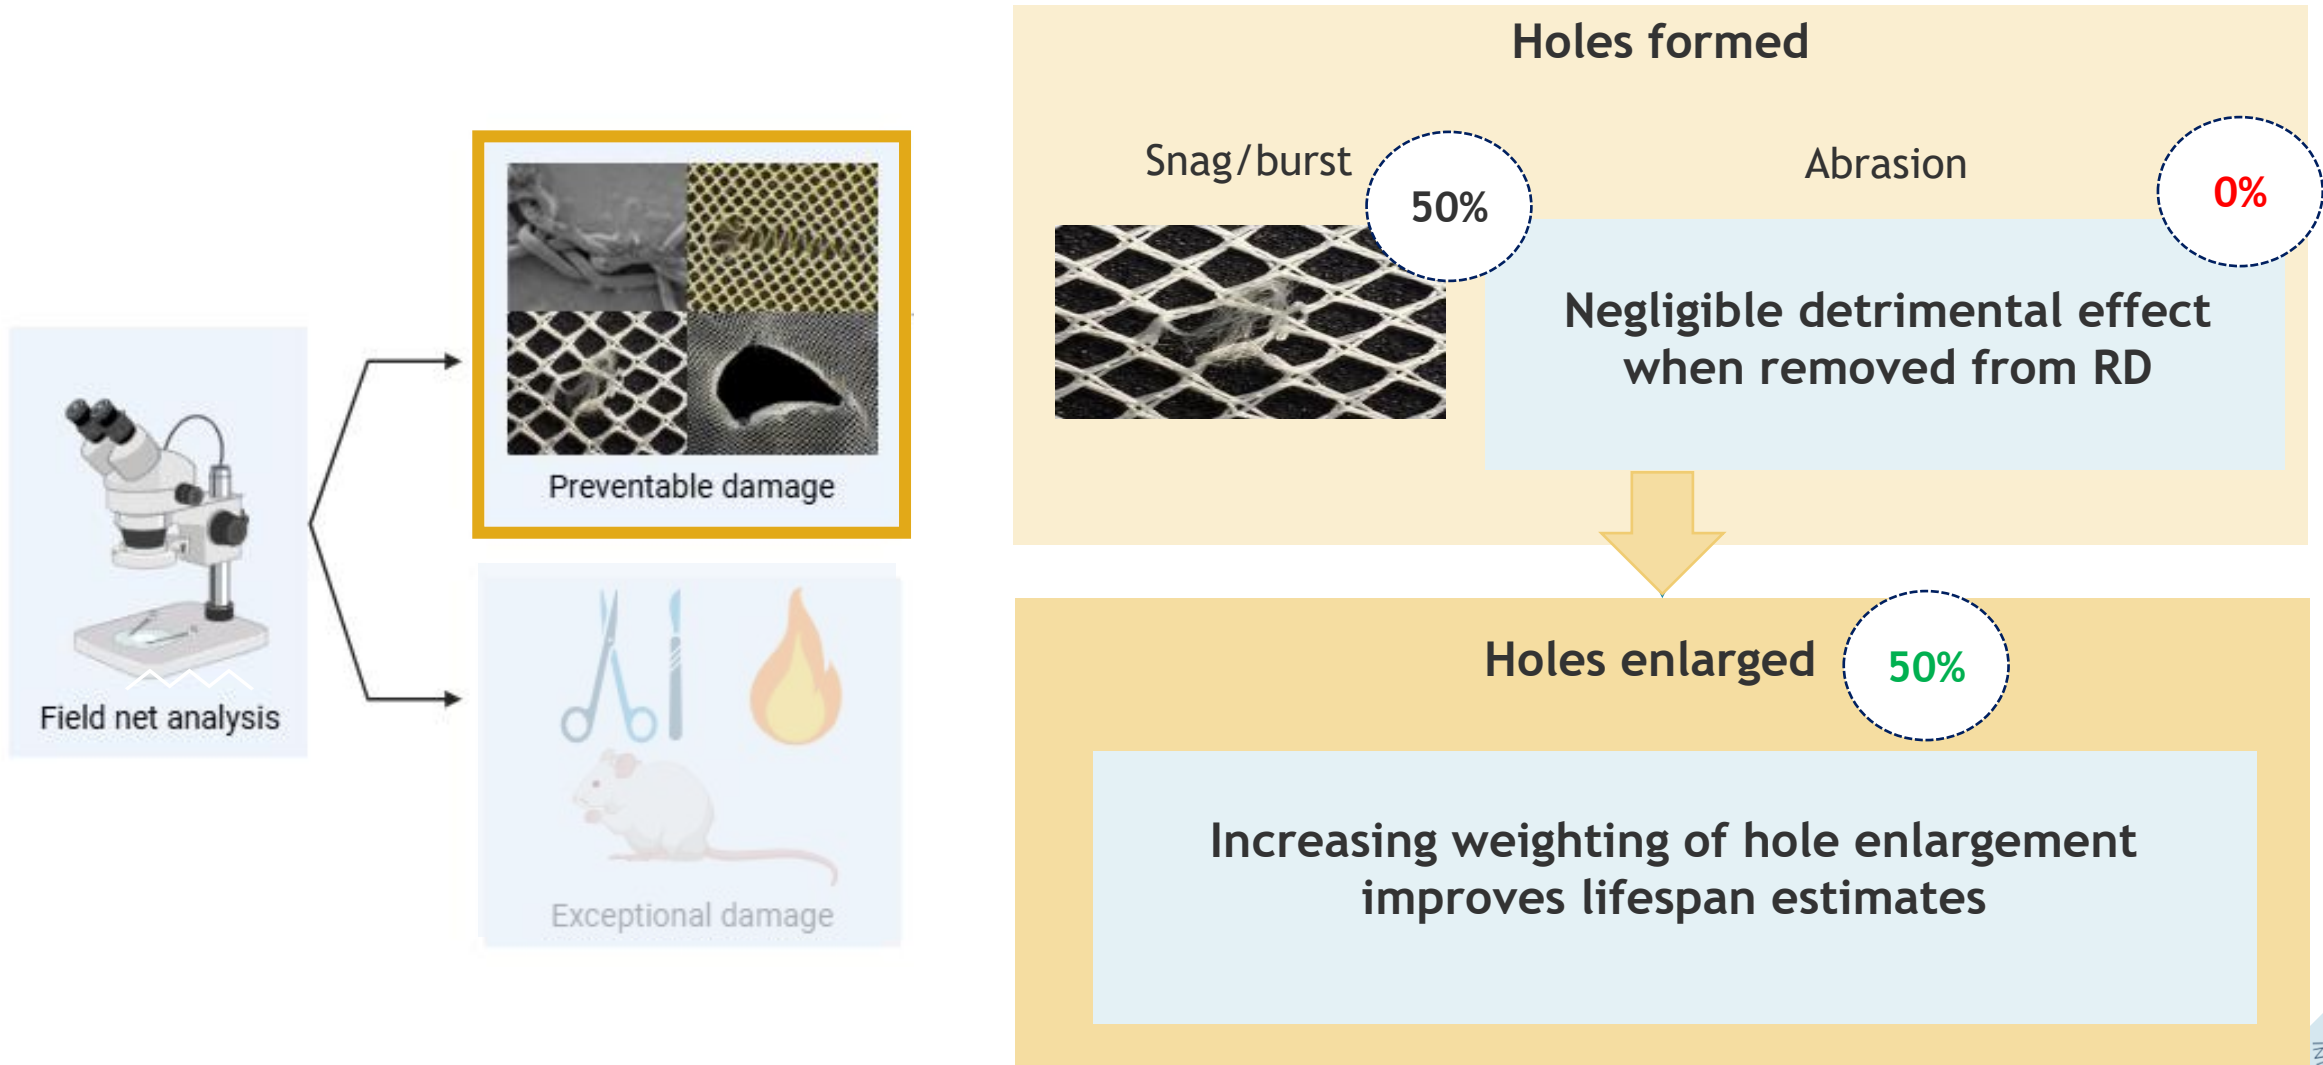

This section shows two types of damage on a mesh. On the left, 'Snag/burst' is shown with an SEM image of a mesh where a strand has broken through, accompanied by a white circle containing '50%'. On the right, 'Abrasion' is shown with an SEM image of a mesh with a small, irregular hole, accompanied by a red circle containing '0%'. A large yellow arrow points down from this section to the next.

Holes enlarged 50%

Ladder/Unravel

This section shows 'Holes enlarged' with a green circle containing '50%'. Below this, under the heading 'Ladder/Unravel', are three SEM images showing different stages of mesh damage: a mesh with a small hole, a mesh with a larger hole, and a mesh with a very large, irregular hole.

Refining the RD score - Abrasion removed and hole enlargement increased

Refining the RD score - Defining the RD as the weighted RD

25%

Snag
resistance

25%

Bursting
strength

25%

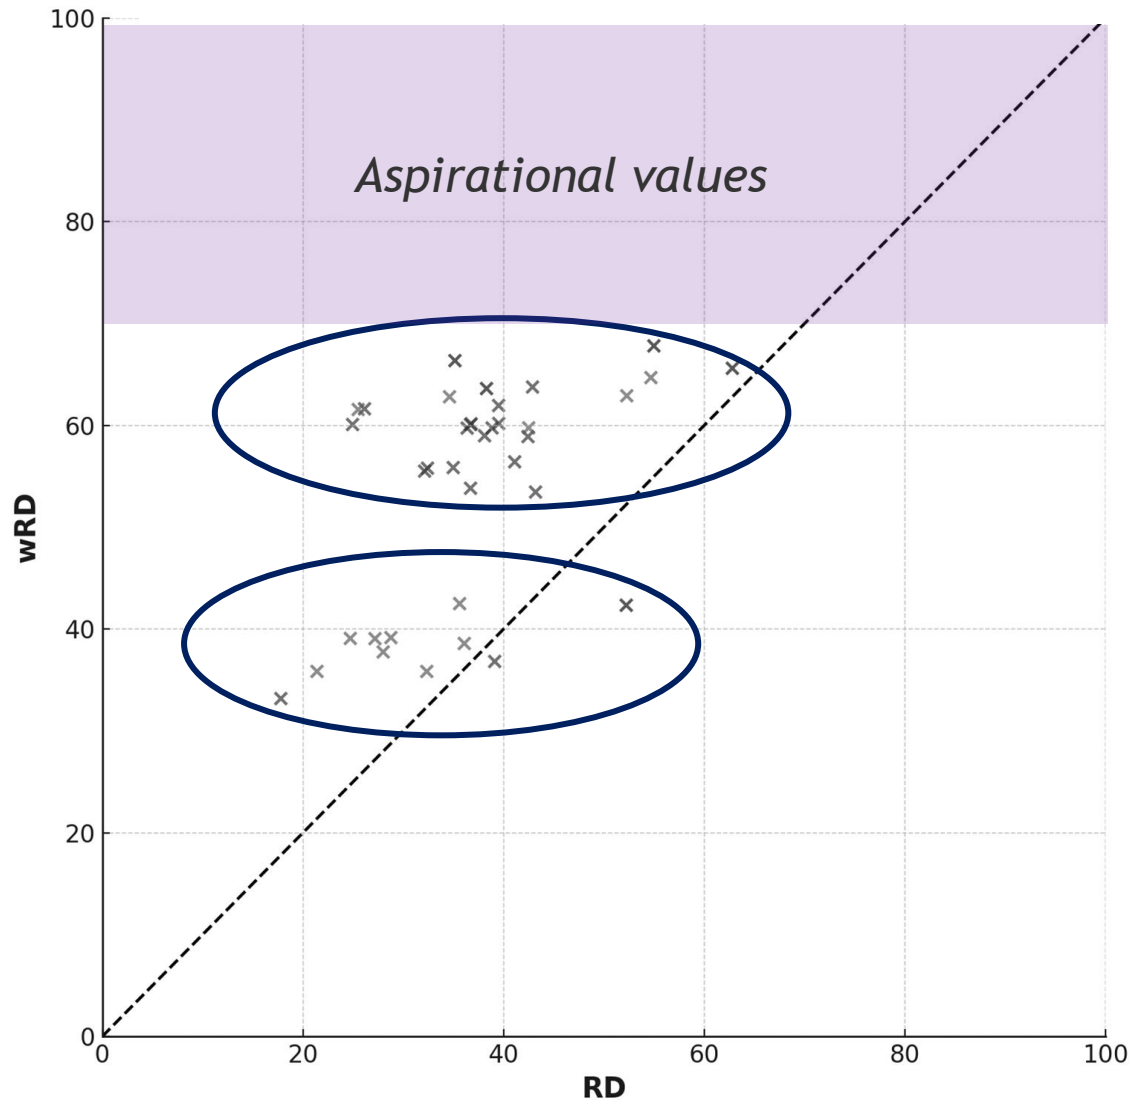

Hole
enlargement

25%

Abrasion
resistance

*Referred to hereafter as 'weighted RD'
(wRD)*

Refining the RD score - Range of wRD values

Note the bifurcation of wRD scores into two groups

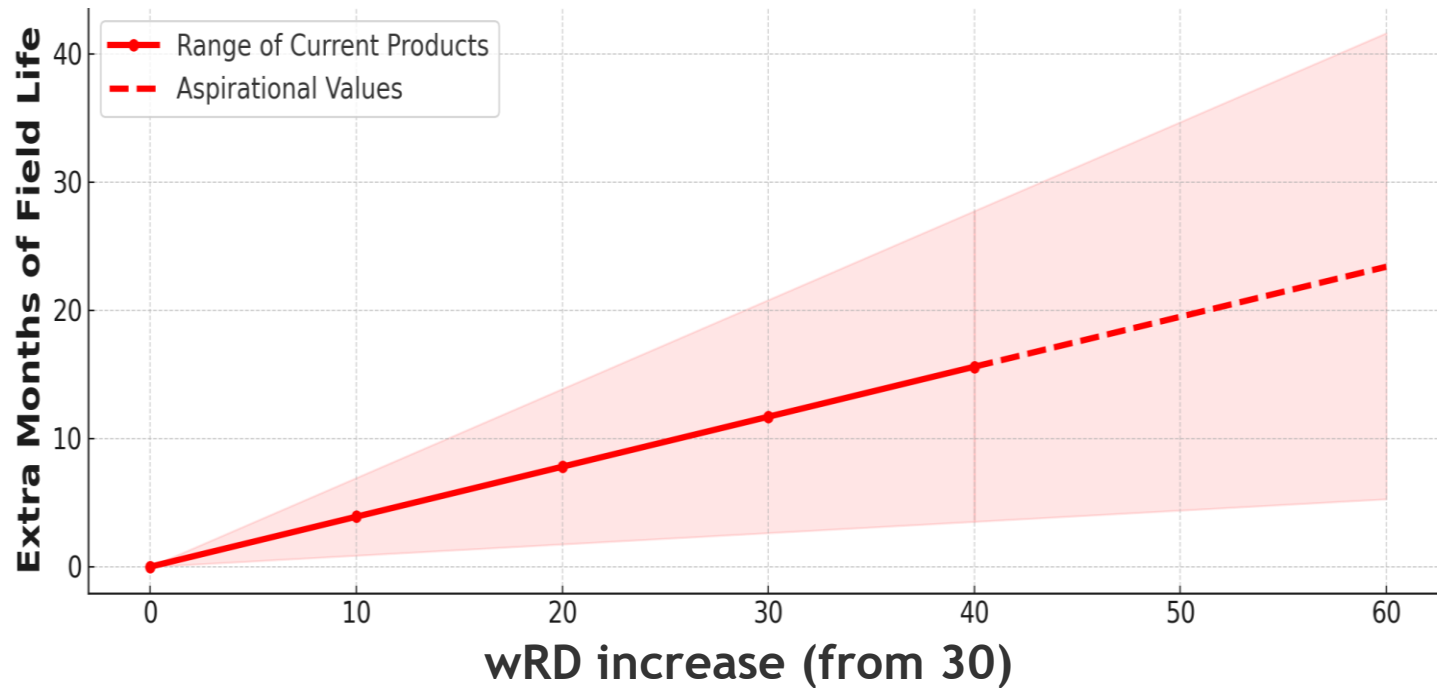

Aspirational data coming from Malawi and Tanzania

TROPICAL
HEALTH

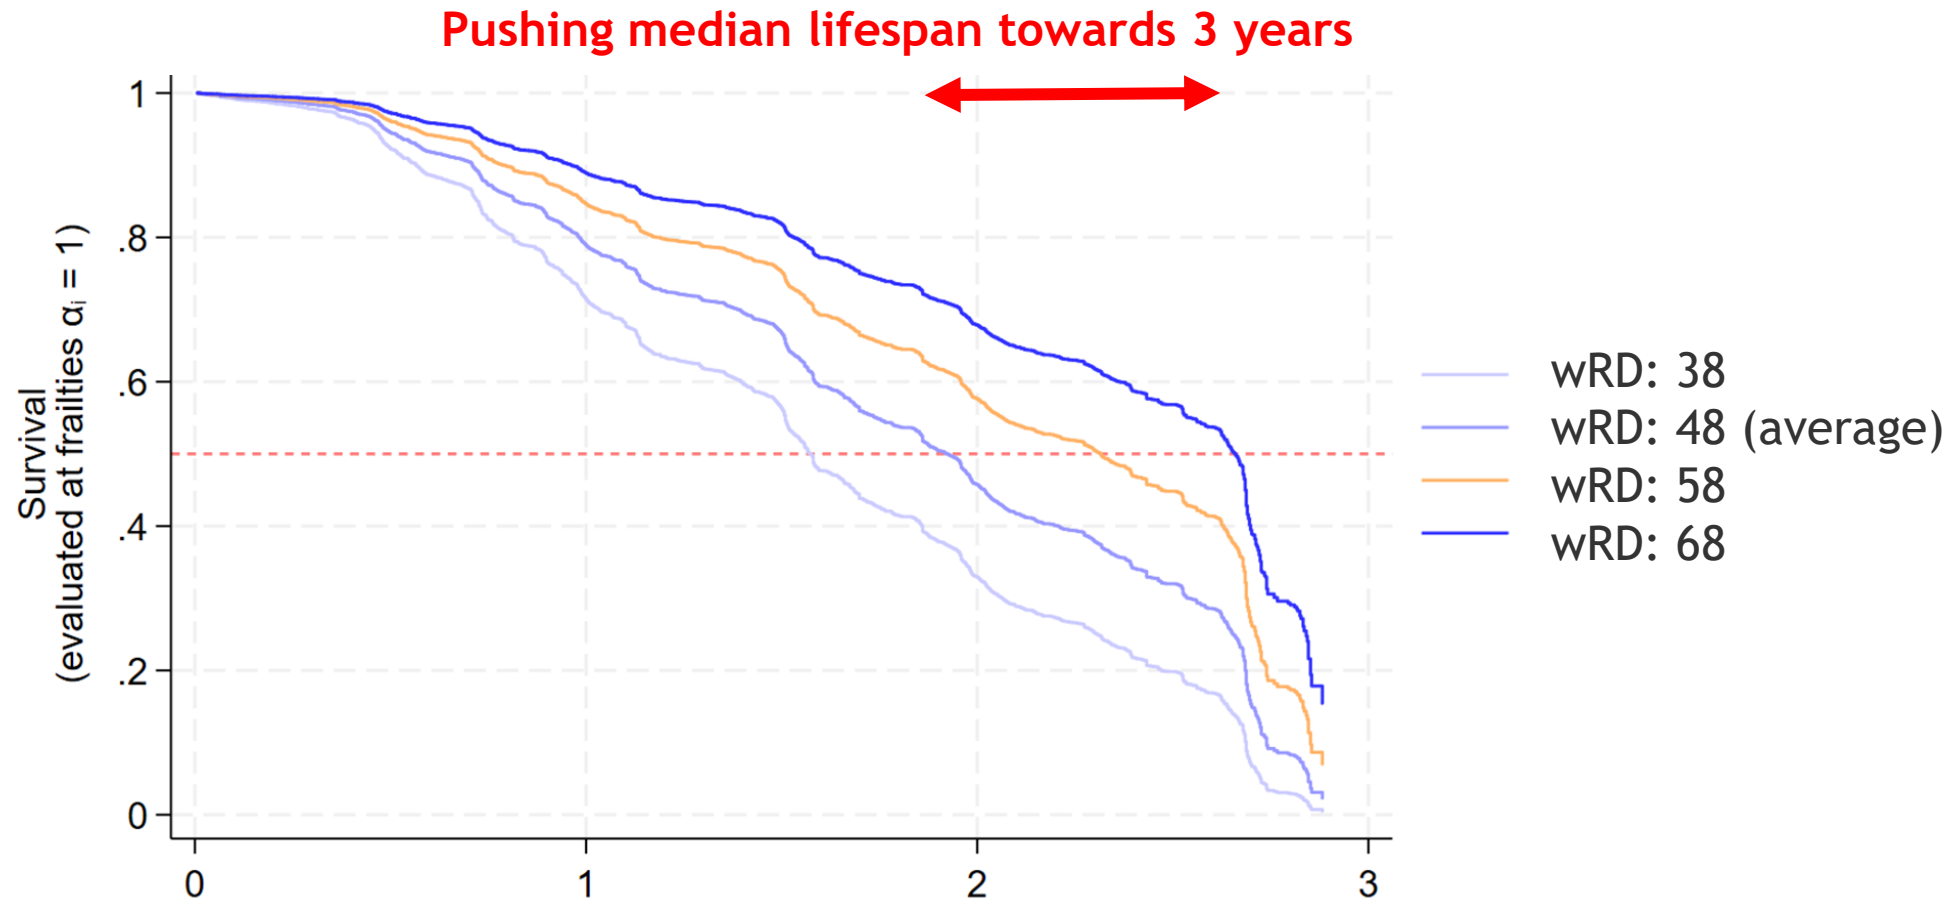

Refining the RD score - Generalising wRD (without country-specific data)

Increasing wRD from 30 to 65
increases median field life by
13.65 months
(95% CI: 3.03-24.16)

Error bar reflects country variation:
*Effect will be larger in some countries
than others*

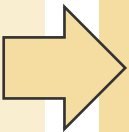

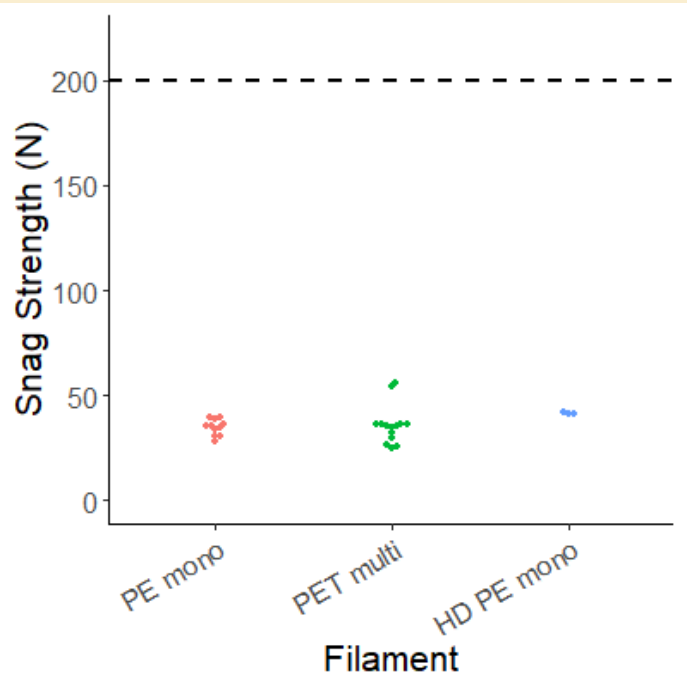

Refining the RD score - Pushing median lifespan to three years

Avenues to innovation - Physical characteristics of nets

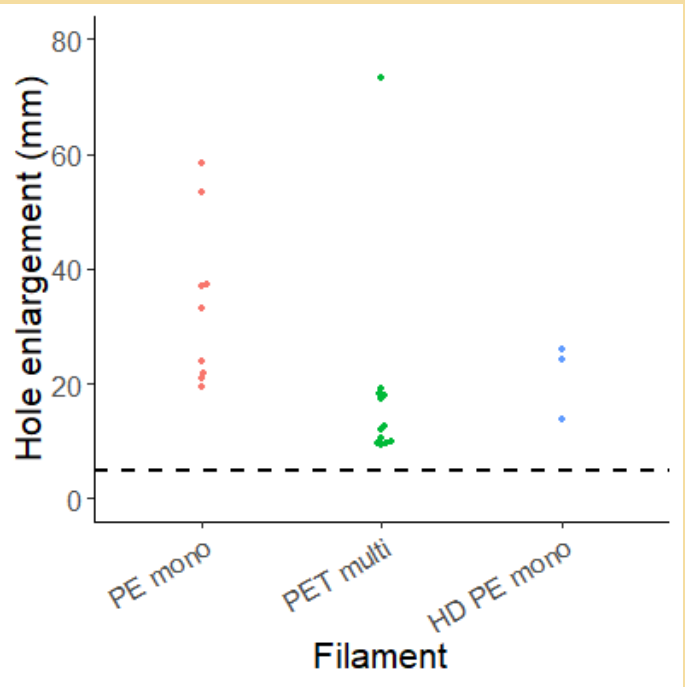

Holes formed

Increasing area density (fabric weight per unit area)?

Holes enlarged

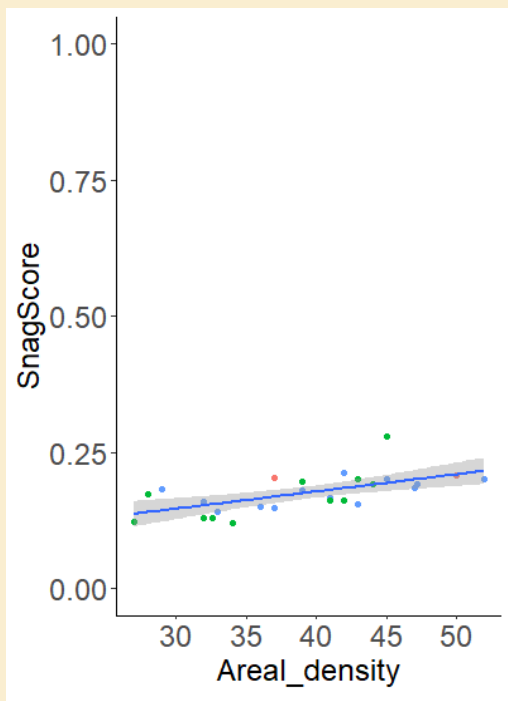

Increasing mesh count or changing knitting type?

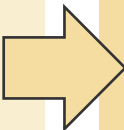

Avenues to innovation - Physical characteristics of nets

Holes formed

Increasing area density (fabric weight per unit area)?

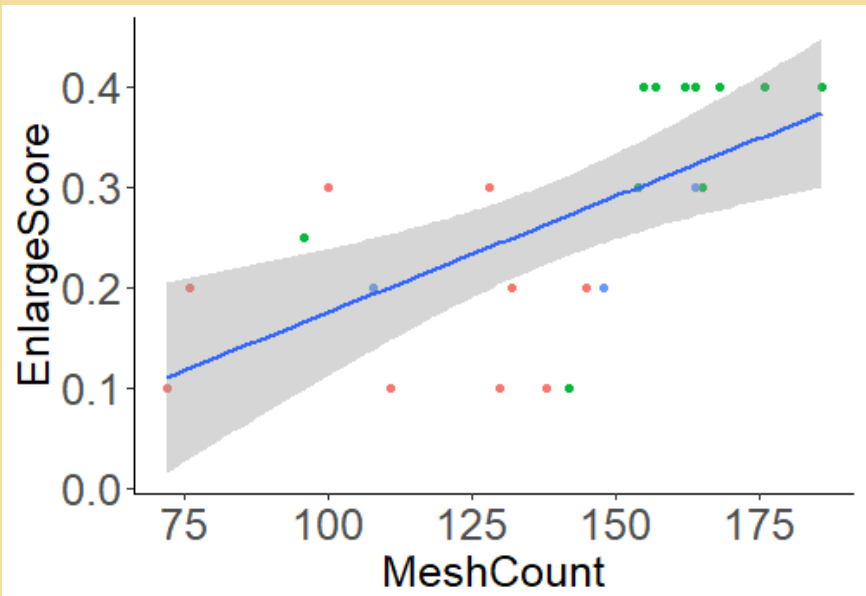

Increasing fabric weight has negligible effect on snag strength

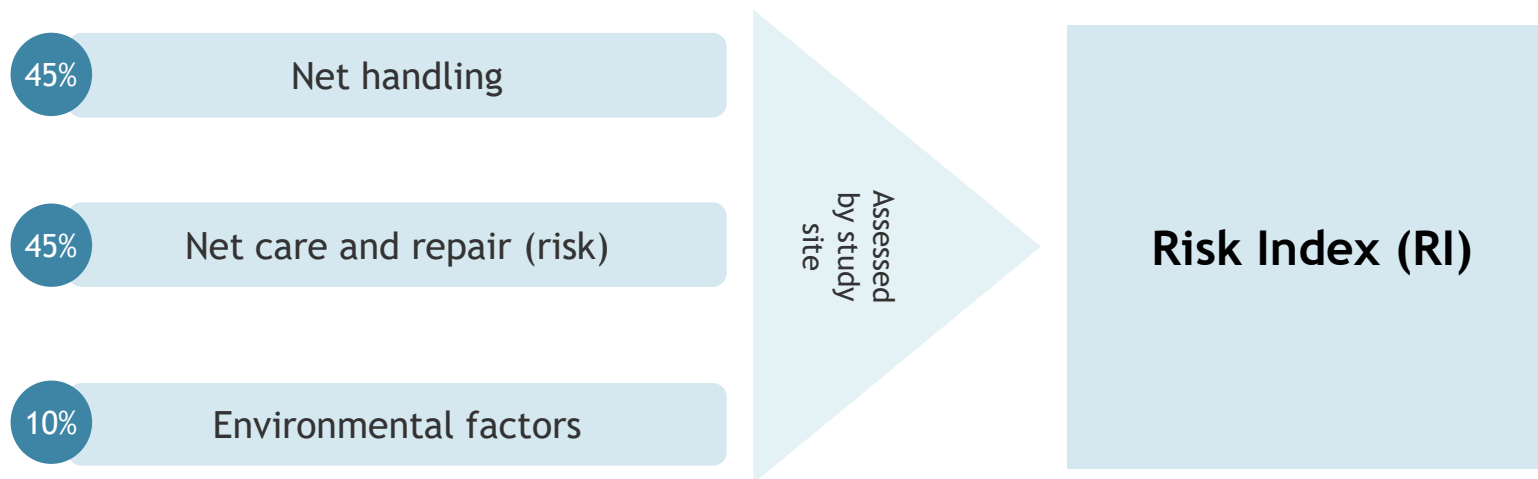

Holes enlarged

Increasing mesh count or changing knitting type?

Avenues to innovation - Refining risk index

Error bar reflects country variation:
*Effect will be larger in some countries
than others*

wRd score

+

Risk Index (RI)

Explain a very large
proportion of ITN
lifespan, $R^2 = \underline{0.76}$

**TROPICAL
HEALTH**

Key take home message

Increasing wRD from 30 to 65 increases median field life by 13.65 months

(10 point increase in wRD = 3.9 months)

Big thank you to Steve Poyer, Matt Worges, Eleanore Sternberg, Anna Trett, Tara Seethaler, Steve Russell and Angus Spiers
